Color guide for the best results when reading codes

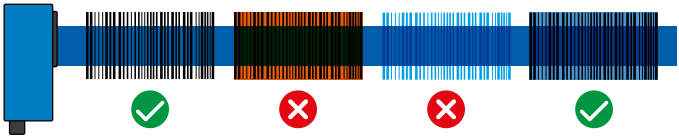
Optimize your reading results

The right choice or color for codes and their backgrounds is decisive for the quality of the reading results of a code reader. The best packaging design is not worth a thing when delays in the production process are caused due to poor code legibility.

Physical laws of light absorption result in a code reader not “seeing” the same as the human eye in colored light. Make sure there is sufficient contrast between the code color and background color.

Code reader with red light

Code reader with blue light



Code reader with white light

The example panel helps you preselect the colors and to test the codes you have created.
